

How The Kits Are Made

Life-Work Potential Limited

Starting Materials

The starting material for different kits has varied, so there isn't a simple answer to this except to say we always use the best we can at the time regardless of cost to us.

A lot of the chemicals, additives, biochemicals etc come from actual substances bought through a big laboratory supplier - sometimes the starting material has cost us as much as GB Pounds 400 /USD 600 for a small starting sample!

Some stuff comes from microscope slides e.g. many of the parasites. All of the pathology/histology slides come from human tissue microscope slides, many bought from a retired pathologist in the USA.

Some of the early kits (e.g. the metals) come from RAE cards. Occasionally we use high-quality research standard digital microscopy images, and very occasionally we use rates developed by Bruce Copen, one of the most respected figures in this field.

Sometimes we use homeopathic potencies as the starter - this is particularly true with some of the more lethal bacteria and viruses - obtained from very reputable suppliers.

The Copying Machine

We use three machines: two are from the Bruce Copen Laboratories - one of the foremost researchers in this field over many years - and the other, which we only use rarely, is from Metabolics. These machines are able to copy the energy pattern from one substance into a blank medium.

The Vials

The glass vials come from a reputable German supplier and are produced by consistently using a Quality Assurance System according to DIN EN ISO 9001:2000.

The Carrier Medium

The water is specially filtered for us by a company that really knows about purifying water and also about energy considerations. They use a unique process that really enhances the water's ability to hold energy patterns clearly. The bottles are then filled with this water for us by another firm who strips down the machine and replaces the rubber hoses before they do this.

As you can see, we are really taking the maximum care to ensure the crucial fundamental integrity of the vials and the kits we produce.
